

1 Next steps

This project is two files: `markpublish.yaml` and this chapter. Replace both with your own content – nothing here is needed once you start writing.

1.1 Build it

```
markpublish build           # PDF
markpublish build --target html # standalone HTML
markpublish build --target all  # both
```

1.2 Look things up

```
markpublish cheatsheet
```

Renders a two-page reference: every key of `markpublish.yaml` on page one, themes and templates on page two. It is generated by the version you have installed, so it cannot drift out of date.

1.3 Add a chapter

Write a Markdown file, then list it under a part's `chapters:` in `markpublish.yaml`. Paths are relative to the config file:

```
parts:
- title: "Main"
  break_before: "none"
  chapters:
    - file: "next-steps.md"
      title: "Next steps"
    - file: "chapters/01_introduction.md"
      title: "Introduction"
```

A document is always two levels: parts divide it, chapters carry the content.

1.4 Change the look

```
markpublish export-template default ./templates
```

Copies the built-in theme into your project, where markpublish picks it up automatically on the next build.
